## In the Claims:

Please amend claims 1-2, 6-20, and 24-27, as indicated below.

- 1. (Currently amended) A computer-implemented method for providing differentiated quality of service in an application server, comprising:
  - a server system receiving a request <u>for service from a client</u>, wherein said request includes <u>an encoding specifying</u> a current user role <u>and a requested service</u>; and

in response to receiving the request for service:

accessing pre-determined policy data;

- establishing a quality of service context based on the <u>specified</u> current user role included in said request and based on said policy data; and
- propagating said quality of service context with said request in the server system, wherein said propagating comprises sending data indicating the quality of service context with the request.
- 2. (Currently amended) The method of claim 1, wherein said request further includes information indicating at least one of a requested service, a time constraint[[,]] or a user identity.
- 3. (Previously presented) The method of claim 1 wherein said quality of service context includes information indicating service class and a deadline.
- 4. (Original) The method of claim 1 wherein said establishing a quality of service context is completed at an ingress point.

- 5. (Previously presented) The method of claim 4 wherein said ingress point is at least one of a web server or a protocol manager service within said server system.
- 6. (Currently amended) The method of claim 1 further comprising, propagating the same quality of service context with a subsequent <u>sub-request related to of</u> said request.
- 7. (Currently amended) The method of claim 1 wherein said propagating includes inserting said quality of service context into data sent with the request adjacent to at least one of a security and transaction context.
- 8. (Currently amended) The method of claim 1, wherein <u>said propagating</u> <u>comprises</u> a load balancing service <u>dispatches</u> <u>dispatching</u> said request, including said quality of service context, to an application server in a plurality of application servers <u>in</u> <u>the server system</u>, based on said quality of service context.
- 9. (Currently amended) The method of claim 1, wherein <u>said propagating</u> <u>comprises</u> a request manager service <u>dispatches</u> <u>dispatching</u> said request, including said quality of service context, to a software component in a plurality of software components <u>in the server system</u>, based on said quality of service context.
- 10. (Currently amended) A <u>non-transitory</u> computer-readable storage medium, comprising program instructions executable to implement:

a server system, configured to:

receive a request for service from a client, wherein said request includes an encoding specifying a current user role and a requested service; and

in response to receiving the request for service:

access pre-determined policy data;

establish a quality of service context based on the <u>specified</u> current user role included in said request and based on said policy data; and

propagate data indicating said quality of service context with said request in the server system.

- 11. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 10, wherein said request further includes information indicating at least one of a requested service, a time constraint[[,]] or a user identity.
- 12. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 10, wherein said quality of service context includes information indicating service class and a deadline.
- 13. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 10, wherein said establishing a quality of service context is completed at an ingress point.
- 14. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 13, wherein said ingress point is at least one of a web server or a protocol manager service within said server system.
- 15. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 10, further comprising program instructions executable to: propagate the same quality of service context with a subsequent <u>sub-request related to of</u> said request.

- 16. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 10, wherein said propagating includes inserting said quality of service context <u>into data sent with the request</u> adjacent to at least one of a security and transaction context.
- 17. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 10, wherein <u>said propagating comprises</u> a load balancing service <u>dispatches</u> <u>dispatching</u> said request, including said quality of service context, to an application server in a plurality of application servers <u>in the server system</u>, based on said quality of service context.
- 18. (Currently amended) The <u>non-transitory</u> computer-readable storage medium of claim 10, wherein <u>said propagating comprises</u> a request manager service <u>dispatches</u> <u>dispatching</u> said request, including said quality of service context, to a software component in a plurality of software components <u>in the server system</u>, based on said quality of service context.
  - 19. (Currently amended) A first computer system, comprising:

a processor;

a memory storing program instructions;

wherein the processor is operable to execute the program instructions to implement a server system configured to:

receive a request <u>for service from a client</u>, wherein said request includes <u>an encoding specifying</u> a current user role <u>and a requested service</u>; and

in response to receiving the request <u>for service</u>, the server system is further configured to:

access pre-determined policy data;

establish a quality of service context based on the <u>specified</u> current user role included in said request and based on said policy data; and

propagate data indicating said quality of service context with said request in the server system.

- 20. (Currently amended) The system of claim 19, wherein said request further includes information indicating at least one of a requested service, a time constraint[[,]] or a user identity.
- 21. (Previously presented) The system of claim 19, wherein said quality of service context includes information indicating service class and a deadline.
- 22. (Original) The system of claim 19, wherein said establishing a quality of service context is completed at an ingress point.
- 23. (Previously presented) The system of claim 22, wherein said ingress point is at least one of a web server or a protocol manager service within said server system.
- 24. (Currently amended) The system of claim 19, further comprising program instructions to: propagate the same quality of service context with a subsequent <u>sub-reguest related to of said request</u>.

- 25. (Currently amended) The system of claim 19, wherein said propagating includes inserting said quality of service context into data sent with the request adjacent to at least one of a security and transaction context.
- 26. (Currently amended) The system of claim 19, wherein <u>said propagating</u> <u>comprises</u> a load balancing service <u>dispatches</u> <u>dispatching</u> said request including, said quality of service context, to an application server in a plurality of application servers <u>in</u> <u>the server system</u>, based on said quality of service context.
- 27. (Currently amended) The system of claim 19, wherein <u>said propagating</u> <u>comprises</u> a request manager service <u>dispatches</u> <u>dispatching</u> said request, including said quality of service context, to a software component in a plurality of software components <u>in the server system</u>, based on said quality of service context.
